## Equipment Needed to Install Mule-Hide Heat-Weld Membranes

**Introduction** - This section is intended to serve as a general guideline of the equipment that the contractor may need to successfully install a Mule-Hide Heat-Weld Membrane Roofing System.

**General** - The following list of hand tools should be included for an average crew of 4 - 6:

- One automatic welder
- Asphalt-free extension cord (#10/3 wire, 220 volt) with 220/30 amp male- female twist lock plugs for use with the automatic welder, not to exceed 100 feet in length
- 2 or 3 hand welders with nozzles
- Asphalt-free extension cords (#14/3 wire, 110 volts)
- 3 or 4 rubber hand rollers
- 1 pair of scissors per person
- 3 standard screw guns with disengaging clutch (RPM range of 1800-2500 with adjustable nose piece)
- Tape measures and one 100-foot tape
- 2 or 3 cotter pin extractors for probing seams
- Non-permanent ink pens (water soluble)
- Chalk lines with non permanent chalk (blue chalk)
- 4-inch wide paint brushes
- One-half inch nap paint rollers with solvent-resistant cores and handles
- Clean cotton rags
- Caulking guns
- Push brooms
- Asphalt-free waterproof canvas or other type of waterproof tarp for covering Mule-Hide products and equipment

**Specialized Equipment** - The Mule-Hide Roofing System requires 4 types of specialized equipment:

- Mule-Hide-approved automatic hot air seaming machine
- Mule-Hide-approved hand-held seaming machine
- Generator large enough to provide power to automatic welder and hand gun(s)

**WARNING:** Never touch the metal portion of the fan housing, blower tube or blower nozzle of the automatic welder or hand-held heat guns. They become extremely hot and can cause severe burns.

## **MEMBRANE WELDING**

The Mule-Hide heat-weld membranes can be permanently fused together by the application of super-heated air and pressure. To provide the required heat and pressure, Mule-Hide heat-weld membrane roofing systems specify an automatic welder for making field seams. A hand welder is specified when an automatic welder cannot be used (see next section).

### **Automatic Welder**

General Description: An automatic welder is an electrically powered, self-propelled device that utilizes electrical resistance heating and fan-forced hot air in combination with its own weight (including additional weight mounted on the exterior housing) to fuse the Mule-Hide heat-weld membranes together.

### **Technical Specifications**

The following specifications are for general information. Consult the manual accompanying the equipment for additional details.

- **Electrical requirements:** 220V, 30A (minimum fused), 7500 W (minimum recommended available power), single-phase current. If using a generator, ensure generator is of sufficient size to power all welding tools (hand gun(s), automatic welder) run from generator.
- **Power cord and extensions:** #10, 3-conductor type may be used for distances up to 100 ft.; for longer lengths, consult an electrical contractor. The use of the highest quality electrical cords extend equipment life and improve overall performance.
- **Supplemental weight:** When welding Mule-Hide field membrane, an additional weight is to be fixed on the exterior housing over the wheels of the automatic welder. Most automatic welders have removable external weights.
- **Adjustments:** Tracking alignment, nozzle alignment, forward speed, temperature of heating element and airflow louver (and therefore hot air output).
- **Welding speed:** The speed of the welder must be no faster than necessary to reproduce good hot-air weld and will vary according to environmental conditions. As a general rule, 10 to 12 feet per minute (fpm) is a typical speed in warm summer temperatures; 8 fpm or less is typical in cold weather temperatures.
- **Metal track (if required by welder manufacturer):** Several lengths, 8 foot each of 24-26 gauge galvanized metal for use as a track for the automatic welder. The metal tracks may be necessary to minimize wrinkles during welding.

**NOTE:** Conditions seldom justify running at maximums speed, which usually result in inconsistent seam quality. As ambient temperatures change throughout the day, the operator must determine the optimum operating speed and temperature of the automatic welder. It is good roofing practice to conduct test seaming before welding the field seams. See page 4 for test welding instructions.

## Procedure - Before Connecting to Power

Use the automatic hot-air welder to make all field seams as general practice; the nozzle can be adjusted to weld near-horizontal seams (typical field seams).

Be sure to take the following preliminary steps when using an automatic unit.

1. Supplemental weight. Fix the supplemental weight to the exterior housing over the wheels. This weight will ensure that the proper pressure is applied to the seam being welded.
2. Check hot-air nozzle alignment and adjust if required.
3. Welding and non-welding positions. The hot-air nozzle can be locked into an UPWARD non-welding position, or into its DOWNWARD welding positions. The nozzle and blower assembly can be freely raised from the welding position after the release trigger on the blower housing is pulled and the entire assembly is slid OUTWARD from the machine. In this OUTWARD position, the nozzle and blower assembly escapes the detent that locks it into the DOWN position, and can be rotated to the UP position, where it will lock when the trigger is released. Position the hot-air nozzle so that it is in its DOWNWARD welding position and visually check to ensure that the nozzle will not direct the hot air into the silicone drive wheel or belt. Such misdirected super-heated air can quickly ruin the expensive wheel or belt drive. Any misalignment of the nozzle should be corrected at this time. After ensuring that the nozzle is properly aligned, return the hot-air nozzle to its UPWARD, non-welding position.

Be sure that the blower and transmission power switches are OFF and the blower temperature control and speed control are set to ZERO.

**Checkpoint:** At this point, it is assumed that you are ready to hot-air weld a field seam, and the following requirements have been met:

- A roll of Mule-Hide heat-weld membrane has been attached to the roof deck, and a second roll has been unrolled to provide a 5-1/2-inch overlap for mechanically attached and a 3" overlap for fully adhered over the previously attached edge, per Standard Mule-Hide Specifications.
- The surfaces to be hot-air welded are clean. If these surfaces are dirty, they must be rag-wiped clean with Fantastik® (or similar cleaner), then wiped with a clean rinse rag and thoroughly dried. The seam area should then be wiped with a clean rag dampened with Mule-Hide Membrane Cleaner to ensure removal of any remaining dirt or soap film.
- With the nozzle and blower assembly in the UP position, the automatic welder is positioned so that the silicone pressure wheel or belt is placed at the edge of overlapping sheet and the beveled guide wheel in front is at the edge of the top Mule-Hide sheet.
- Transmission and blower switches are OFF and speed and heat controls are set to ZERO.

**WARNING:** Never touch the metal portion of the fan housing blower tube, or blower nozzle. They become extremely hot and can cause severe burns.

## Procedure - Connecting to Power

With the preliminaries done, you are ready to hot-air weld.

4. Connect the machine to power.
5. Turn the heater/blower power switch ON.
6. Set the temperature switch to the desired setting (1004° F is a good starting point).
7. Allow the machine to warm up (generally around 5 minutes).

**NOTE:** Test seams should be made at least at the start of work each morning and afternoon or any other time there is a noticeable change in temperature. Test seams should be made on use scrap material. After scrap material has cooled, attempt to physically tear apart and examine for consistent 1-1/2 to 2-inch wide fully laminated seams.

8. Prepare to set the machine in motion.
  - If ambient temperature is higher than 60°F, adjust the transmission speed control switch so that the machine will move at about 12 fpm; further adjustment may be required once you are underway, depending on the quality of the seam produced.
  - If ambient temperature is 40-60°F, adjust the machine to move at about 10 fpm; further adjustment may be required, depending on the quality of the seam produced.
  - If ambient temperature is less than 40°F, adjust the machine to move at less than 8 fpm; the best rate will have to be determined based on the quality of the seam produced. As a general rule, the colder the ambient temperature - and, hence, the membrane - the more slowly the automatic welder will have to proceed in order to produce good seams.

**NOTE:** As there are no ideal working conditions and ambient temperatures change throughout the day, the operator must determine the operating speed of the automatic welder.

**CAUTION:** The operator of the welding equipment should be absolutely sure that the machine is positioned properly to begin welding before proceeding to the next step. Remember the guide handle points IN THE DIRECTION THAT THE MACHINE WILL MOVE.

9. Separate the overlapping sheets. Place one hand palm-down on the blower housing, and put your index finger on the release trigger. With your other hand, use a seam probe (or similar tool) to separate the two overlapping Mule-Hide heat-weld membranes so that the nozzle can be slid between them.
10. Insert the blower nozzle between the sheets. Pull the trigger, and position the nozzle between the membrane sheets, locking it in the DOWN welding position. Immediately proceed to the next step to prevent burning the membrane!
11. Start the machine moving. Quickly turn the transmission switch ON.

**NOTE:** Some machines start automatically. The machine will start moving and welding the seam. Mark the start of the seam with a water-soluble marker.

12. Stay on course. As the automatic welder proceeds, keep the small guide wheel at the front of the machine at the edge of the top sheet. Steer the machine from the front to minimize zigzagging, which is likely to result from steering from the rear. If you go off-course, simply get back on course quickly. Seam deficiencies can be repaired later with the hand welder.

**IMPORTANT:** Keep plenty of slack in the power cord. Any drag can pull the machine off course.

13. Adjust to the speed that produces the best weld. The guidelines set in Step 8 provide good starting points. As welding proceeds, some trial-and-error adjustments are required. Generally, adjusting the speed will be the most effective means of "dialing in" the best seam production. When the ambient temperature is very high, it may be necessary to turn the temperature down.

### Rules-of-Thumb for Judging Seam Quality

- The seamed membrane is not discolored, increase speed if membrane discolors (yellow/brown). If ambient temperature is very high and membrane discolors even when speed is at maximum, turn down the temperature control.
  - Bubbling. If welder setup is marginally too hot, the seam surface may exhibit a slight bubbling appearance.
  - Voids and wrinkles. A good seam has no voids or wrinkles and is 2-inches wide with the exposed edge tight. If not, see "Repairing Voids and Wrinkles," and "Repairing Holes in Membranes."
  - Seam strength may be tested when cool. For best results, testing seams 8 hours after hot-air welding is recommended.
14. Completing a welding run. At the end of a run, lock the nozzle in it's UP, non-welding position and turn the transmission switch OFF to stop the machine's movement. NOTE: Some machines stop automatically when the nozzle is taken out of the seam. Mark the end of the seam with a water-soluble marker.
  15. Clean the nozzle frequently. The nozzle should be wire-brushed frequently to remove hot particles of the Mule-Hide heat-weld compound. (Some applicators wire-brush after each welding run.) If not removed, such particles are likely to be deposited by the nozzle, forming brown streaks at the edge of the lap; more than aesthetics is at stake - the presence of such particles in the seam can affect seam integrity.
  16. Cool the welder down. At the completion of a period of welding - for example, on breaks - with the nozzle locked in the UPWARD position, turn the temperature adjustment dial to the lowest setting. The heating element will shut off, but the blower will continue to operate, cooling the heating element. After about five minutes, turn the power switch OFF.

NOTE: Some machines will shut down automatically after pushing only one button.

## Precautions

As with any high-power electrical equipment used outdoors, use accepted practice and common sense to avoid injury. Some suggestions:

- Do not operate any heat welder during storms.
- Use extreme caution to avoid burns. The temperature of the super-heated air in this machine can reach approximately 1200 °F (645°C).
- Guard against snagging the power cord.
- If the power cord should become disconnected while the machine is operating, it is desirable to reconnect as quickly as possible, with careful attention to safety, to avoid possible damage from overheating. Switch the machine OFF to avoid arcing when reconnecting to power. Reconnect to power. Turn the power switch ON to resume normal operation.
- Inspect the power cord and connections before each welding session. Repair or replace worn or frayed cords and connectors promptly.
- Although the unit may be a double-insulated design, a ground fault interrupter (GFI) at the power source is still recommended.

**NOTICE:** This equipment is for industrial use only. These instructions are for general information only. Prior to actual operation of the hot-air welding equipment, refer to the operating instructions that are provided by the manufacturer. Handling and use of this equipment is beyond Mule-Hide's control. Mule-Hide does not accept any liability for the results.

All statements herein are expressions of opinion, which by performance and testing are believed to be accurate and reliable, and are presented without any knowledge that such recommended uses may infringe any patent. No warranty of any kind whatsoever, expressed or implied, is made or intended.

## Hand Welder

General Description: The hand-held hot-air welder is an electrical powered, hand-held device that utilizes electrical resistance heating and fan-forced, super-heated air to heat Mule-Hide heat-weld membranes. A hand-held rubber roller is used in conjunction with the welder to apply the pressure that fuses the heated Mule-Hide heat-weld membrane surfaces to each other.

The hand-held welder is used as general practice to touch up imperfect seams. It is also used when the self-propelled automatic model is inappropriate, such as in roofing details and on highly sloped surfaces.

### Technical Specifications:

- **Electrical requirements:** 115V, 15A (minimum fused), 2,500 W (minimum recommended available power), single-phase current. If using a generator, ensure generator is capable of providing adequate wattage for

using the automatic welder and hand gun(s) at the same time.

- **Power cord and extensions:** #12, 3-conductor type may be used for distances up to 100 ft.
- **Adjustments:** Temperature of heating element and air flow louvers (and therefore hot air output).
- **Accessories:** 3/4-in. (20-mm) nozzle (for welding details), 1-1/2-in. (40-mm) nozzle (for straight welding, as when repairing field seams), hand-held silicone rubber roller.
- **Welding speed:** Speed will vary according to ambient weather conditions, element control settings and user proficiency.

## Procedure - Before Connecting to Power

Use the hand-held hot-air welder to repair and/or make all seams that cannot be made by the automatic welders. Be sure to take the following preliminary steps before plugging in the equipment:

1. Fit the appropriate nozzle. In general, the 1-1/2-in. (40 mm) nozzle should be fitted to the welder when making or repairing straight welds; the 3/4-in. (20 mm) nozzle should be fitted when welding flashing details.
2. Be sure the power is OFF and the heat adjustment switch is set to ZERO.

**Checkpoint:** At this point, it is assumed the seam is ready to hot-air weld, and the following requirements have been met:

- All fasteners are in place and the two surfaces to be welded are in position.
- The surfaces to be hot-air welded are clean, free of adhesive (a potential problem with flashing details) and other contaminants. If these surfaces are dirty or contaminated, they must be rag-wiped clean with Fantastik® or similar general cleaner, then wiped with a clean rinse rag and dried thoroughly. The seam area should then be wiped with a clean rag dampened with Mule-Hide Membrane Cleaner to ensure removal of any remaining dirt or soap film.
- During the warm-up period, hot air from the welder should be directed in a safe direction.
- A rubber hand roller is available.

**WARNING:** Never touch the metal portion of the fan housing, blower tube or blower nozzle. They become extremely hot and can cause severe burns.

## Procedure - Connecting to Power

With the preliminaries done, begin hot-air welding.

1. Connect the machine to power. Ensure that the welder is pointed in a safe, unobstructed direction.
2. Switch the power on. Turn the power switch ON and turn the heat adjustment switch to its highest position.
3. Warm-up the welder for 5 minutes.

**NOTE:** When first starting out or when welding confined work areas such as corners and pipe penetrations, it is advisable to turn the heat setting down a few notches to avoid applying too much heat.

4. Insert the nozzle into the lap approximately 2" back from the edge of the membrane to create an air dam. Position the nozzle between the surfaces to be welded and quickly position the hand roller on the outer membrane about 1/8 to 1/4 in. from the end of the nozzle.

**NOTE:** More heat is needed when beginning a weld than after a weld is underway, because the membrane is cool. In addition, the super-heated air has an easy escape before a seam is formed. As welding proceeds, the membrane warms up and the hot air from the welder is partially trapped by the seam. Be prepared to pick up the pace.

5. Roll the seam. When the membrane becomes softened, apply a firm pressure to the roller and roll it across the seam in strokes about 3 in. long.
6. After finishing the first pass down the seam to create the air dam, repeat the process to complete the seam. When making the final pass down the seam, keep a small (1/8") portion of the tip exposed beyond the edge of the membrane to ensure a complete weld all the way across the seam.
7. Adjust seaming speed to produce the best weld. As the seaming continues, some trial-and-error adjustment of seaming speed will be required. The membrane surfaces must be heated sufficiently to permit the roller pressure to fuse them together, yet the membrane must not be overheated.

### Rules-of-Thumb for Judging Seam Quality

- The seamed membrane is not discolored, increase seaming speed if membrane discolors (yellow-brown).
  - Bubbles and thinning: Overheating the membrane causes small bubbles and overstretching to the point of leaving too little sheet thickness, especially when working with unreinforced material. Another sign of overheating is a darkened "smeared" appearance on the seam.
  - Voids and wrinkles. A good seam has no voids or wrinkles. If voids or wrinkles are present, see "Repairing Voids and Wrinkles."
8. Clean the nozzle frequently. As with the automatic welding machine, the nozzle of the hand welder should be wire-brushed frequently to remove hot particles of the Mule-Hide heat-weld compound that may adhere to it. If not removed, such particles are likely to be deposited by the nozzle; the presence of such burned particles in the seam can affect seam integrity.
  9. Cool the welder down. When the welder is to be shut down at the completion of a period of welding - turn the temperature adjustment dial to its lowest setting. The heating element will shut off, but the blower will continue to operate, cooling the heating element. Set the welder down so that hot air from the welder is pointed in a safe direction. After about five minutes, turn the power switch OFF.

## Precautions

As with any high-power electrical equipment used outdoors, use accepted practice and common sense to avoid injury. Some suggestions:

- Do not operate any heat-welding equipment during storms.
- Use extreme caution to avoid burns. The temperature of the super-heated air in this machine can reach approximately 800°F (427°C).
- Guard against snagging the power cord.
- If the power cord should become disconnected while the machine is operating, it is desirable to reconnect as quickly as possible, with careful attention to safety, to avoid possible damage from overheating. Switch the machine OFF to avoid arcing when reconnecting to power. Reconnect to power. Turn the power switch ON to resume normal operation.
- Inspect the power cord and connections before each welding session. Repair or replace worn or frayed cords and connectors promptly.
- Use of a GFI at the power source is recommended.

**NOTICE:** This equipment is for industrial use only. These instructions are for general information only. Prior to actual operation of the hand-held welding equipment, refer to the operating instructions that are provided by the manufacturer. Handling and use of this equipment is beyond Mule-Hide's control. Mule-Hide does not accept any liability for the results.

All statements herein are expressions of opinion, which by performance and testing are believed to be accurate and reliable, and are presented without any knowledge that such recommended uses may infringe any patent. No warranty of any kind whatsoever, expressed or implied, is made or intended.

## Seam Probing

General Description: the probing of hot-air welded seams is an important step in the application of a Mule-Hide roof, and is your best insurance for successful inspection.

**SEAMS WITH VOIDS AND WRINKLES HAVE BEEN THE MOST COMMON DEFECTS CITED BY MULE-HIDE INSPECTORS OVER THE YEARS.**

To ensure consistently high-quality seaming on the job, be sure that ALL seams are probed with an appropriate seam probing tool each work day, and all deficiencies noted/marked with a water-soluble marker and repaired as promptly as possible with a hand-held, hot-air welder. Mule-Hide recommends that seams are probed with a cotter pin puller.

### Procedure - Probing the Seams

The probing of seams should not be done until the hot-air welds have thoroughly cooled. As a general procedure, seam probing and repair of deficiencies should be done for all seams approximately 8 hours after they are initially welded.

**WARNING:** Premature probing can open warm seams that would have been perfectly acceptable once they had cooled.

1. Draw probing tool tip along seams. Gripping the probing tool by the handle, draw its tip along the edge of the hot-air welded seam. Apply firm pressure into the seam junction - not into the bottom sheet. The tool should not penetrate into the lap area.
2. Mark deficiencies. Using a water-soluble marker, mark off the beginning and end of each void.
4. Repair deficiencies promptly. Using a hand-held welder, repair all seam deficiencies as quickly as possible. Mule-Hide requires that repairs be made the same day that they are discovered.
5. Check repairs. After the repaired seams have cooled completely, probe them again. If the repair is successful, wipe off the water-soluble marker line; if not, do the repair over.

SYSTEMS:

ALL TPO SYSTEMS

DETAIL NO.:

**MHT-UN-108B**

REVISION DATE: 10/2013

**MULE-HIDE  
PRODUCTS CO., INC.**

NOTES:

1. DETAILS TO BE USED IN CONJUNCTION WITH STANDARD GUIDE SPECIFICATIONS CONTAINING REQUIREMENTS FOR NAILERS, INSULATION, SLIPSHEETS, ETC.
2. ACCORDING TO PROJECT CONDITIONS, THE SPECIFIER AND/OR APPLICATOR MUST IDENTIFY THE WIDTH DIMENSIONS OF THE ROOF PERIMETERS AND CORNERS IN ACCORDANCE WITH FM DATA SHEETS 1-28 AND 1-29 BASED UPON THE FOLLOWING FORMULA:
  - 0.4 TIMES THE BUILDING HEIGHT OR
  - 0.1 TIMES THE BUILDING'S LESSER PLAN DIMENSION, WHICHEVER IS SMALLER

THE MINIMUM PERIMETER/CORNER WIDTH SHALL BE NO LESS THAN 3 FEET

3. FOR STEEL DECKS:
  - ALL FASTENERS MUST ENGAGE TOP FLUTES OF DECK
  - IN THE FIELD OF THE ROOF, SEAMS (FASTENER ROWS) MUST RUN PERPENDICULAR TO THE DECK FLUTES
  - PERIMETER HALF SHEETS ARE TO BE USED ONLY ON SIDES OF ROOF WHEN THE SEAMS RUN PERPENDICULAR TO THE DECK FLUTES
4. 10" WIDE TPO PRESSURE-SENSITIVE RUSS CAN BE USED BENEATH FIELD SHEETS IN LIEU OF FASTENERS AND PLATES INSTALLED THROUGH THE MEMBRANE OR PERIMETER HALF SHEETS.
5. USE ADDITIONAL HALF SHEETS INSTALLED WITH SEAMS RUNNING PERPENDICULAR TO THE DECK FLUTES TO MEET OR SLIGHTLY EXCEED FM PERIMETER DIMENSION REQUIREMENTS AS OUTLINED IN NOTE 2 ABOVE.  
EXAMPLE: A 14' PERIMETER DIMENSION WOULD REQUIRE FOUR 4' PERIMETER SHEETS (14' DIVIDED BY 3.5" COVERAGE PROVIDED BY A 4' WIDE SHEET)

REFER TO MULE-HIDE TECHNICAL BULLETIN #TPO-MA02-2006 FOR PERIMETER ENHANCEMENT REQUIREMENTS

 WARRANTY, CONTRACTOR MUST USE  
 MULE-HIDE METAL PRODUCTS. REFER TO  
 DETAILS MHT-3110A OR MHT-3115A

NOTES:

1. WOOD NAILER MUST EXTEND PAST TOTAL WIDTH OF DECK FLANGE.
2. APPROXIMATELY 1/8" DIAMETER BEAD OF CUT-EDGE SEALANT IS REQUIRED ON CUT EDGES OF TPO REINFORCED MEMBRANE.

<b>MULE-HIDE PRODUCTS CO., INC.</b>	<b>SNAP-ON FASCIA WITH SPRING CLIPS SYSTEMS:</b>	<b>DETAIL NO.:</b> <b>MHT-UN-202A</b>
	<b>ALL TPO SYSTEMS</b>	REVISION DATE: 10/2013

NOTES:

1. WOOD NAILER MUST EXTEND PAST TOTAL WIDTH OF DECK FLANGE.
2. APPROXIMATELY 1/8" DIAMETER BEAD OF CUT-EDGE SEALANT IS REQUIRED ON CUT EDGES OF TPO REINFORCED MEMBRANE.

<p><b>MULE-HIDE PRODUCTS CO., INC.</b></p>	<p><b>SNAP-ON FASCIA SYSTEMS:</b> ALL TPO SYSTEMS</p>
<p><b>DETAIL NO.:</b> <b>MHT-UN-202B</b></p> <p>REVISION DATE: 10/2013</p>	

NOTES:

1. IF INCIDENTAL/PERIODIC PONDED WATER IS EXPECTED, THE FASCIA SYSTEM MUST BE ELEVATED AND SCUPPERS PROVIDED FOR DRAINAGE.
2. CONTACT METAL-ERA (800-558-2162) FOR INSTALLATION INSTRUCTION MANUAL FOR STEP-BY-STEP PROCEDURES AND FOR THE VARIOUS PRODUCT FEATURES AVAILABLE.
3. ANCHOR-TITE FASCIA SYSTEM IS A PATENTED EDGE SYSTEM MANUFACTURED BY METAL-ERA INC.
4. ANCHOR-TITE FASCIA SYSTEM IS ELIGIBLE FOR A SHEET METAL WARRANTY FROM MULE-HIDE.

NOTE:  
THIS DETAIL IS ACCEPTABLE FOR USE IN A  
20-YEAR WARRANTED SYSTEM

<b>MULE-HIDE PRODUCTS CO., INC.</b>	<b>ANCHOR-TITE FASCIA SYSTEM BY METAL-ERA, INC. SYSTEMS:</b>	<b>DETAIL NO.:</b> <b>MHT-UN-204</b>
	<b>ALL TPO SYSTEMS</b>	REVISION DATE: 10/2013

**NOTE:**

IF SHEETMETAL IS TO BE INCLUDED IN THE WARRANTY, CONTRACTOR MUST USE MULE-HIDE METAL PRODUCTS. REFER TO DETAILS MHSM-3500, MHSM-3510, OR MHSM-3511.

**NOTES:**

1. INSTALL A BEAD OF APPROVED SEALANT BETWEEN THE CLIP AND THE TPO REINFORCED MEMBRANE.
2. SNAP ON COVER SHALL BE A MINIMUM THICKNESS OF: STEEL - 24 GAUGE ALUMINUM - .032 INCHES

**NOTE:**

THIS DETAIL IS ACCEPTABLE FOR USE IN A 20-YEAR WARRANTED SYSTEM

**FASCIA / DRIP EDGE SYSTEM**

**MULE-HIDE  
 PRODUCTS CO., INC.**

NOTES:

1. AN OVERLAP OF 1½" WILL BE REQUIRED BETWEEN SECTIONS OF MEMBRANE COATED METAL. A BEAD OF SEALANT IS REQUIRED IN EACH OVERLAP.
2. A WOOD NAILER IS REQUIRED. TOP OF WOOD NAILER TO BE FLUSH WITH TOP OF INSULATION.
3. DRIP EDGE MUST BE FASTENED 6" ON CENTER.
4. A CLEAT MUST BE INSTALLED ON ALL DRIP EDGE WITH A FACE OF 4" OR GREATER. CLEAT MUST BE FASTENED 6" ON CENTER. ALL FASTENERS ON THE CLEAT MUST BE WITHIN 1-¾" OF THE BOTTOM EDGE.
5. USE STAINLESS STEEL FASTENERS WHEN ATTACHING INTO ACQ TREATED WOOD.

NOTE:

THIS DETAIL QUALIFIES TO BE INCLUDED IN ANY MULE-HIDE LABOR AND MATERIAL WARRANTY ONLY IF THE FORMED DRIP EDGE AND CLEATS ARE MANUFACTURED BY MULE-HIDE.

MULE-HIDE PREMANUFACTURED  
MEMBRANE COATED DRIP EDGE

SYSTEMS:

ALL TPO SYSTEMS

DETAIL NO.:

**MHT-3120**

REVISION DATE: 10/2013

**MULE-HIDE  
PRODUCTS CO., INC.**

NOTES:

1. FASTEN THE T-EDGE BASE TO THE WOOD NAILER (ENOUGH TO HOLD IN PLACE) WITH GALVANIZED NAILS. BE SURE TO INSTALL A SPLICE PLATE BEHIND EACH SECTION OF T-EDGE.
2. ATTACH THE MEMBRANE COATED METAL HOOK STRIP TO THE T-EDGE BASE AND FASTEN IT 6" ON CENTER WITH APPROVED FASTENERS. BE SURE THAT THIS ROW OF FASTENERS ALSO PENETRATES THROUGH THE T-EDGE BASE. HOOK STRIPS MUST OVERLAP EACH OTHER BY 1" ALLOW FOR A 3/8" GAP BETWEEN INDIVIDUAL SECTIONS OF THE T-EDGE BASE. STAGGER THE SEAMS BETWEEN THE BASE AND THE HOOK STRIP 12" MINIMUM.
3. A CONTINUOUS BEAD OF SEALANT IS REQUIRED BETWEEN THE MEMBRANE COATED METAL HOOK STRIP AND THE T-EDGE BASE.
4. A CLEAT IS REQUIRED ON FACES THAT ARE 4" OR GREATER IN SIZE. ALL FASTENERS ON THE CLEAT MUST BE WITHIN 1-3/4" OF THE BOTTOM EDGE.
5. WELD REINFORCED TPO STRIPPING MATERIAL TO THE HOOK STRIP AND FIELD MEMBRANE.
6. USE STAINLESS STEEL FASTENERS WHEN ATTACHING INTO ACQ TREATED WOOD.

NOTE:

THIS DETAIL QUALIFIES TO BE INCLUDED IN ANY MULE-HIDE LABOR AND MATERIAL WARRANTY

MULE-HIDE PREMANUFACTURED T-EDGE METAL EDGE DETAIL SYSTEMS:  
ALL TPO SYSTEMS

DETAIL NO.:  
**MHT-3550**

REVISION DATE: 10/2013

**MULE-HIDE PRODUCTS CO., INC.**

NOTES:

1. FASTEN THE T-EDGE BASE TO THE WOOD NAILER (ENOUGH TO HOLD IN PLACE) WITH GALVANIZED NAILS. BE SURE TO INSTALL A SPLICE PLATE BEHIND EACH SECTION OF T-EDGE.
2. ATTACH THE MEMBRANE COATED METAL HOOK STRIP TO THE T-EDGE BASE AND FASTEN IT 6" ON CENTER WITH APPROVED FASTENERS. BE SURE THAT THIS ROW OF FASTENERS ALSO PENETRATES THROUGH THE T-EDGE BASE. HOOK STRIPS MUST OVERLAP EACH OTHER BY 1". ALLOW FOR A 8" GAP BETWEEN INDIVIDUAL SECTIONS OF THE T-EDGE BASE. STAGGER THE SEAMS BETWEEN THE BASE AND THE HOOK STRIP 12" MINIMUM.
3. A CONTINUOUS BEAD OF SEALANT IS REQUIRED BETWEEN THE MEMBRANE COATED METAL HOOK STRIP AND THE T-EDGE BASE.
4. A CLEAT IS REQUIRED ON FACES THAT ARE 4" OR GREATER IN SIZE. ALL FASTENERS ON THE CLEAT MUST BE WITHIN 1-3/4" OF THE BOTTOM EDGE.
5. WELD REINFORCED TPO STRIPPING MATERIAL TO THE HOOK STRIP AND FIELD MEMBRANE.
6. USE STAINLESS STEEL FASTENERS WHEN ATTACHING INTO ACQ TREATED WOOD.

NOTE:

THIS DETAIL QUALIFIES TO BE INCLUDED IN ANY MULE-HIDE LABOR AND MATERIAL WARRANTY

REVISION DATE: 10/2013

**MULE-HIDE  
PRODUCTS CO., INC.**

NOTES:

1. THE USE OF THIS DETAIL IS NOT TO EXCEED A 2" PER 12" SLOPE.
2. A WOOD NAILER IS REQUIRED. TOP OF WOOD NAILER IS TO BE FLUSH WITH TOP OF INSULATION. BE SURE THAT THE WOOD NAILER EXTENDS AT LEAST ½" BEYOND THE HORIZONTAL EDGE OF THE SNAP-ON BASE.
3. THE FASTENERS USED TO ATTACH THE BASE TO WOOD NAILERS, AND THE MEMBRANE TO THE FACE OF THE NAILERS, MUST BE SPACED NO GREATER THAN 6" ON CENTER.
4. ALLOW FOR ⅛" EXPANSION GAP BETWEEN 10' LENGTHS OF SNAP-ON BASE. OVERLAP THE SNAP-ON COVERS 2" BETWEEN 10' LENGTHS.
5. WHEN INSTALLING THIS DETAIL WITH A 6" OR GREATER VERTICAL SURFACE, ADDITIONAL MECHANICAL ATTACHMENT IS REQUIRED ON THE SNAP-ON BASE. THE ADDITIONAL FASTENERS MUST BE WITHIN 1'-3" OF THE BOTTOM EDGE.
6. MEMBRANE SHOULD EXTEND BEYOND WOOD NAILER BY MINIMUM 1"
7. MAXIMUM MEMBRANE STRIPPING THICKNESS ON THIS DETAIL IS AS FOLLOWS:
  - TPO - 45 MIL
8. USE STAINLESS STEEL FASTENERS WHEN ATTACHING INTO ACO TREATED WOOD.

NOTE:

THIS DETAIL QUALIFIES TO BE INCLUDED IN ANY MULE-HIDE LABOR AND MATERIAL WARRANTY

NOTE:

THIS DETAIL IS ACCEPTABLE FOR USE IN ALL EXTENDED WARRANTIES AND HIGH WIND ZONES.

NOT FOR USE ON 20 YEAR WARRANTY PROJECTS. TERMINATION MUST HAVE COMPRESSION SEAL. SEE ALL OTHER 624 DETAILS

- NOTES:
- COUNTERFLASHING SHALL BE ELEVATED ABOVE PONDED WATER.
  - NOT FOR USE ON 20 YEAR WARRANTY PROJECTS (REFER TO DETAIL 624-B).
  - BONDING ADHESIVE IS NOT REQUIRED WHEN SHEETMETAL IS USED. FASTENERS MUST BE SPACED A MAXIMUM 12" O.C.
  - IF THE SHEETMETAL IS TO BE INCLUDED IN THE WARRANTY, CONTRACTOR MUST USE SHEETMETAL PRODUCTS REFER TO DETAILS MISM-6130, MISM-6145, OR MISM-6146.

624-A COUNTERFLASHING TERMINATION

- FOR USE ON 20 YEAR WARRANTY PROJECTS.
- ALLOW 1/4" TO 1/2" SPACING BETWEEN CONSECUTIVE LENGTHS OF TERMINATION BAR.
- BONDING ADHESIVE IS NOT REQUIRED WHEN FLASHING IS 18" OR LESS.

624-C MECHANICAL TERMINATION

FOR USE ON 20 YEAR WARRANTY PROJECTS. TERMINATION BAR IS NOT REQUIRED ON 10 YEAR WARRANTY PROJECTS (REFER TO DETAIL 624-A)

- APPLY ON HARD SMOOTH SURFACE ONLY; NOT FOR USE ON ROOF.
- DO NOT WRAP COMPRESSION TERMINATION AROUND CORNERS.
- FASTENERS OF METAL BAR MUST PROVIDE CONSTANT COMPRESSION ON WATER CUT-OFF MASTIC.
- BONDING ADHESIVE IS NOT REQUIRED WHEN FLASHING IS 18" OR LESS.
- IF THE SHEETMETAL IS TO BE INCLUDED IN THE WARRANTY, CONTRACTOR MUST USE MULE-HIDE METAL PRODUCTS. REFER TO DETAILS MISM-6130, MISM-6145, OR MISM-6146.

624-D COPING STONE TERMINATION

FOR USE ON 20 YEAR WARRANTY PROJECTS.

624-E CAP FLASHING TERMINATION

NOTES:  
IF THE SHEETMETAL IS TO BE INCLUDED IN THE WARRANTY, CONTRACTOR MUST USE MULE-HIDE METAL PRODUCTS. REFER TO DETAILS MISM-6130, MISM-6145, OR MISM-6054A & B, OR MISM-6056.

REVISION DATE: 03/2017

1

1. INSTALL CONTINUOUS CLEAT.  
2. INSTALL MEMBRANE COATED METAL WITH 1/2" JOINTS BETWEEN ADJOINING SECTIONS.

2

INSTALL 2" WIDE DUCT TAPE OVER JOINTS OF MEMBRANE COATED METAL & COMPLETELY COVER THE JOINT.

3

HEAT WELD 6" WIDE PIECE OF MULE-HIDE NON-REINFORCED MEMBRANE OVER THE JOINT.

4

POSITION MULE-HIDE REINFORCED FIELD MEMBRANE AND HEAT WELD TO MEMBRANE COATED METAL, A MINIMUM OF 1 1/2" AS SHOWN.

NOTES:

1. REFER TO METAL RETROFIT SPECS FOR PROPER WOOD NAILER FASTENING CRITERIA.
2. INSPECT THE STRUCTURAL INTEGRITY OF EXISTING STEEL MEMBER(S) PRIOR TO ANCHORING NEW WOOD BLOCKING.
3. THICKNESS OF WOOD NAILER(S) TO MATCH WITH THE THICKNESS OF INSULATION.
4. SEE DETAIL T3.1 FOR METAL EDGE INSTALLATION AND REQUIREMENTS OF ANSI/SPRI ES-1 COMPLIANCE.
5. APPROXIMATELY 1/8" DIAMETER BEAD OF CUT-EDGE SEALANT IS REQUIRED ON CUT EDGES OF REINFORCED MEMBRANE.

NOTE:

NOT APPROVED FOR 20-YEAR SYSTEM WARRANTIES OR FOR USE IN HIGH WIND AREAS

**MULE-HIDE PRODUCTS CO., INC. 2011**

**PERIMETER EDGE METAL MEMBRANE COATED METAL SYSTEMS: METAL RETROFIT SYSTEMS TPO MECHANICALLY ATTACHED**

**DETAIL NO.: MMRT-101**

**NOTES:**

1. REFER TO METAL RETROFIT SPECS FOR PROPER WOOD NAILER FASTENING CRITERIA.
2. INSPECT THE STRUCTURAL INTEGRITY OF EXISTING STEEL MEMBER(S) PRIOR TO ANCHORING NEW WOOD BLOCKING.
3. THICKNESS OF WOOD NAILER(S) TO MATCH THE THICKNESS OF NEW INSULATION.
4. FASTENERS USED TO ATTACH SHEET METAL MUST PENETRATE WOOD NAILER A MINIMUM OF 1/4". IF PLYWOOD IS USED AS THE TOP LAYER, FASTENERS MUST PENETRATE A MINIMUM OF 1/4" INTO WOOD NAILER BELOW.
5. TO REMOVE FINISHING OILS, AT NON-COATED METALS, SCRUB METAL FLANGE WITH WEATHERED MEMBRANE CLEANER AND ALLOW TO DRY PRIOR TO THE PRIMER.
6. APPLY TAPE PRIMER TO METAL FLANGE AND TPO MEMBRANE SURFACE PRIOR TO INSTALLING PRESSURE-SENSITIVE CURED COVER STRIP.
7. REFER TO METAL RETROFIT SPEC FOR PROPER MEMBRANE SPLICING PROCEDURES.

**NOTE:**  
THIS DETAIL APPROVED FOR 20-YEAR SYSTEM WARRANTIES.
